

In-Class Exercise

Solve the following recurrence relation:

$$T(n) = 8T(n/2) + 3n$$

$$T(1) = 1$$

Answer

Solve the following recurrence relation:

$$T(n) = 8T(n/2) + 3n$$

$$T(1) = 1$$

$$\text{Find } T(n/2): 8(n/2^2) + 3(n/2)$$

$$\text{Plug in: } T(n): 8[8(n/2^2) + 3(n/2)] + 3n$$

$$\text{Find } T(n/4): 8T(n/2^3) + 3(n/2^2)$$

$$\text{Plug in: } T(n): 8^2 [8T(n/2^3) + 3(n/2^2)] + 8 * 3(n/2) + 3n$$

$$= 8^3 T(n/2^3) + 8^2 * 3n/4 + 8 * 3n/2 + 3n$$

Answer Cont'd

$$\begin{aligned} & 8^3T(n/2^3) + 8^2 * 3n/4 + 8 * 3n/2 + 3n \\ &= 8^3T(n/2^3) + 3n(8^2/4 + 8/2 + 1) \\ &= 8^3T(n/2^3) + 3n(4^2 + 4^1 + 4^0) \end{aligned}$$

➤ Pattern is:

$$8^kT(n/2^k) + 3n[4^{k-1} + \dots + 4^0]$$

We stop recursion at $T(1) = 1$, or $n/2^k = 1$, or $n = 2^k$

Take lg of both sides to remove exponent: $\lg n = k \lg 2$, or $k = \lg n$. Substitute $\lg n$ back in to the equation:

$$\begin{aligned} & 8^{\lg n}T(1) + 3n[4^{\lg n-1} + \dots + 4^0] \\ &= 8^{\lg n}T(1) + 3n[(4^{\lg n} - 1) / 3] \quad (\text{if confused about this step, check the slide in the lectures labeled important math!}) \\ &= 8^{\lg n} + n(4^{\lg n} - 1) \\ &= n^{\lg 8} + n(n^{\lg 4} - 1) \\ &= n^3 + n(n^2 - 1) \\ &= 2n^3 - n = \Theta(n^3) \end{aligned}$$

In-Class Exercise

Given that the comparison that takes place in the *else* statement is the basic operation, analyze Binary Search by finding its recurrence relation and determining its best-case and worst-case order.

```
index BinarySearch(index low, index high)
    if (low > high)
        return 0; // key not found in array
    else
        index middle = ⌊(low + high) / 2⌋
        if (x == S[middle])
            return middle
        else if (x < S[middle])
            return BinarySearch(low, middle - 1)
        return BinarySearch(middle + 1, high)
```

Answer

Base case $\text{low} > \text{high}$ $w(1) = 1$
 $w(n) = w\left(\frac{n}{2}\right) + 1$

Assume implemented in Assembly efficiently, only one check.

$$w\left(\frac{n}{2}\right) = w\left(\frac{n}{4}\right) + 1 \rightarrow w(n) = [w\left(\frac{n}{4}\right) + 1] + 1$$

$$w\left(\frac{n}{4}\right) = w\left(\frac{n}{8}\right) + 1$$

$$w(n) = [w\left(\frac{n}{8}\right) + 1] + 1 + 1$$

$$w\left(\frac{n}{8}\right) + 3$$

$$w(k) = w\left(\frac{n}{2^k}\right) + k$$

stop at case 1 $n/2^k = 1$

$$2^k = n \quad k \lg 2 = \lg n \quad \lg 2 = 1 \quad \text{so } \lg n = k$$

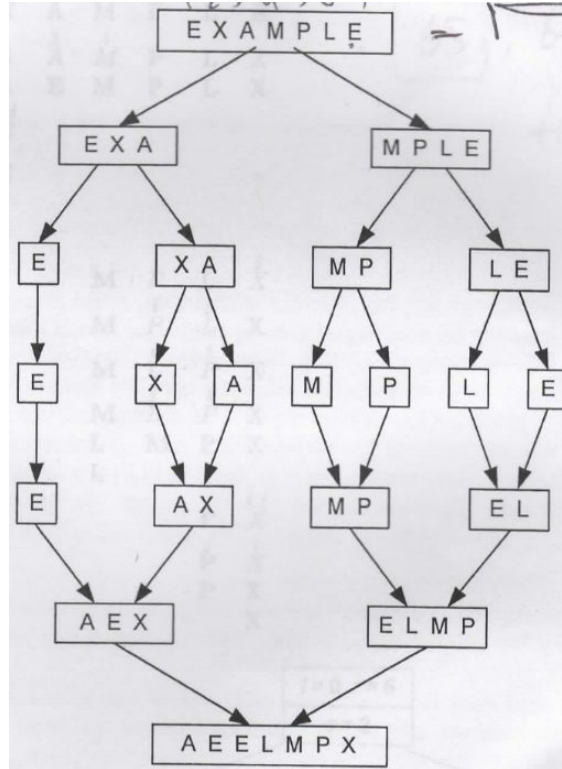

$$1 + \lg n = \Theta(\lg n)$$

In-Class Exercise

1. Sort $[E_1, X, A, M, P, L, E_2]$ in alphabetical order using Mergesort. Show steps.
2. Sort $65, 60_1, 60_2, 60_3$ in nondecreasing order using Mergesort. A sorting algorithm is called **stable** if it preserves the relative order of any two equal elements in its input. Is Mergesort stable? (hint: consider how the *Merge* procedure works)

Mergesort is only stable if the comparison in merge is changed to \leq rather than $<$

In-Class Exercise

$S = \{123, 34, 189, 56, 150, 12, 9, 240\}$

1. Show the recursion tree for sorting S with Quicksort.
2. Show the top-level partition on S .
3. Sort $65, 60_1, 60_2, 60_3$ in nondecreasing order using Quicksort. A sorting algorithm is called **stable** if it preserves the relative order of any two equal elements in its input. Is Quicksort stable?

In-Class Exercise

$S = \{123, 34, 189, 56, 150, 12, 9, 240\}$

1. Show the top-level partition on S .

i	j	S[i]	2	3	4	5	6	7	8
-	-	123	34	189	56	150	12	9	240
2	2	123	34	189	56	150	12	9	240
3	2	123	34	189	56	150	12	9	240
4	3	123	34	189	56	150	12	9	240
5	3	123	34	56	189	150	12	9	240
6	4	123	34	56	189	150	12	9	240
